# Bundle Products

Marketplace Types · https://multivendorx.com/docs/knowledgebase/bundle-product/

## Brief Introduction

Encourage customers to purchase more with attractive product bundles! The Bundled Products module in MultiVendorX Pro allows sellers to combine multiple products into a single bundle and offer them at a special discounted price. Sellers can create different product combinations, set bundle prices, and give customers more value with convenient, cost-effective deals.

## Requirements

- MultiVendorX Pro
- WooCommerce Product Bundles

## Enable Bundled Products

The MultiVendorX Bundled Products feature allows sellers to offer attractive deals by combining multiple products into a single bundle. To enable sellers to create and sell bundled products, you first need to activate the Product Bundle module.

- Go to the **Admin Dashboard** and navigate to **MultiVendorX → Settings → Modules**.
- On the Modules page, scroll down to the **Product Types** section and enable the **Bundle** option.
- Once enabled, sellers can create and sell bundled products from their respective store dashboards.

## Add Bundled Products

Once you have enabled the **Product Bundle** option, sellers can start adding bundled products from their store dashboards.

To create a bundled product, sellers need to follow these steps:

- Navigate to **Products** from the store dashboard menu and select **Add Product**. Alternatively, sellers can directly click the **Add Product** link available in the top menu.
- After adding the relevant details, such as the product name, description, and image, sellers must select **Bundled Product** as the product type.

## Configure Bundled Product Details

Once the product type is selected as **Bundled Product**, sellers need to navigate to the **Bundled Products** tab to configure the bundle.

Here, sellers can add multiple products that they want to offer together as a bundle.

The available options are explained below:

- **Add a Bundled Product** – From the dropdown menu, sellers can select products from their existing published products to include in the bundle.
- **Filter Variations** – This option is available when the selected product is a variable product. It allows sellers to specify which variations customers can purchase as part of the bundle.
- **Override Default Selections** – Also available for variable products, this option allows sellers to override the default attribute values of the bundled products.
- **Optional** – Enabling this option allows customers to decide whether they want to include the respective product in their bundle purchase.
- **Quantity Min and Quantity Max** – These options define the minimum and maximum quantities customers can select for a particular bundled product. Quantity Min specifies the minimum quantity required to purchase the bundle, while Quantity Max sets the maximum quantity customers can add.
- **Shipped Individually** – Controls whether the bundled product is shipped separately from the rest of the bundle.
- **Priced Individually** – When enabled, the price of the bundled product is added to the base bundle price. Sellers can also define a discount for the individual bundled product.

## Advanced Settings

Under the **Advanced Settings** tab, sellers can configure how individual bundled products and their details appear across different sections of the marketplace.

The available options include:

- **Visibility of Product Details** – Controls whether the specific bundled product is displayed on the single product page of the bundle.
- **Visibility of Cart/Checkout** – Controls whether the specific bundled product is displayed on the cart and checkout pages.
- **Visibility of Order Details** – Controls whether the specific bundled product is displayed in the order details.
- **Price Visibility of Product Details** – Controls whether the price of the specific bundled product is displayed on the single product page of the bundle.
- **Price Visibility of Cart/Checkout** – Controls whether the price of the specific bundled product is displayed on the cart and checkout pages.
- **Price Visibility of Order Details** – Controls whether the price of the specific bundled product is displayed in the order details.
- **Hide Thumbnail** – Controls the visibility of the bundled product's image. Leave this option unchecked to display the product thumbnail.
- **Override Title** – Allows sellers to change the title of a specific bundled product. Leave this option unchecked to display the original product title.
- **Override Short Description** – Allows sellers to modify the short description of a specific bundled product. Leave this option unchecked to display the original product short description.
